Using the platform

The working edition accepts CSV files with labeled feature vectors. Users configure hidden layers, epochs and learning rate, review classification metrics and export the trained model.

Public demo

The demo mirrors the working interface: configure parameters, click Train, inspect charts, the confusion matrix and sample C-test logs. CSV files up to 1 MB are read only in the browser and never uploaded. Metrics are illustrative; no training takes place. The ZIP uses production file names but contains only text placeholders for the model and headers.
